If you want a **100% free, forever-free** method to host a webhook server for Meta without paying anything, here are the best options that won't expire or require credit cards:

Method 1: Render (Free Tier)

Render offers a free static site and web service tier for running small scripts (like the Python Flask app provided earlier).

- **Cost:** Completely free.
- **Catch:** Free web services on Render will "spin down" (go to sleep) if they don't receive traffic for 15 minutes. When Meta sends a message after a period of inactivity, the very first message might take about 30 seconds to respond while the server wakes back up. However, for testing and development, it stays up indefinitely without charging you.

Method 2: Railway (Hobby Tier / Trial)

Railway used to have a permanent free tier, but now they typically operate on a trial credit or usage-based model. (So you might eventually need a card or hit a limit, making it *not* entirely lifetime-free).

Method 3: Make.com (Free Tier)

If you want to avoid code entirely:

- **Cost:** Make.com has a **Free Plan** that gives you **1,000 operations per month** forever.
- **Catch:** If your bot handles heavy traffic or test messaging exceeds 1,000 operations a month, you would hit the cap. For light testing and building, it is completely free and won't cost a dime.

Method 4: Ngrok (Free Permanent Account)

If you just want to run the server on your own computer:

- **Cost:** Ngrok offers a permanent **Free Static Domain** tier.
- **Catch:** Your computer must stay turned on and connected to the internet with the script running. If you close your laptop or shut down your script, the webhook will go offline.

Summary Recommendation for 100% Free & Long-Term Use:

1. **For zero code:** Use **Make.com's Free Tier** (just watch the 1,000 monthly operation limit).
2. **For a real hosting server:** Deploy the Python script to **Render's Free Tier**. It runs forever for free, even if it falls asleep after inactivity.
